Dave Doyle
NGS Chief Geodetic Surveyor (Retired)

How You Can Invest in Improving the Status of Passive Control in the National Spatial Reference System

This presentation demonstrates how easy it is for users to provide the National Geodetic Survey (NGS) with improved information on the condition of passive control monuments, including recovery reports, digital images and updated horizontal positions to replace scaled values, using the NGS-provided tool DSWorld. The program also covers the use of the Online Positioning User Service (OPUS) Share Solution utility that allows users to provide NGS information to update future geoid models as well as to capture, manage and share with others their own geodetic control data from a national database.
